

Sequence Diagrams

1. Analyst Login & Authenticated Request

The full OIDC login flow via Keycloak and the JWT verification path every subsequent API call goes through, including JWKS caching/refresh and 401-refresh-or-redirect handling on the frontend.

Sequence 1 - Analyst Login and Authenticated Request

Sequence 1 — Analyst Login & Authenticated Request

2. n8n Automated Email-to-Case Pipeline

The assignment's required automation pipeline: an inbound email is parsed for an IOC, enriched via VirusTotal and OTX inside n8n, then handed to the backend for a full unified threat check, AI summary, and automatic TheHive case creation, ending in Slack + email notifications.

Sequence 2 — n8n Automated Email-to-Case Pipeline

3. AI Chat RAG-Explain Query

The Retrieval-Augmented Generation flow triggered from the AI Chat page: combines the current threat verdict, this IP's own history from Postgres, and the most relevant knowledge-base chunks (Sigma rules, MITRE ATT&CK, CVEs, playbooks), retrieved via Gemini embeddings and cosine similarity, before generating the explanation.
